

ABSTRACT

A multi-point seat-belt includes two shoulder-belt portions, a lap-belt portion, master release-button, belt-feeding device and multi-attachment points.

- 5 Both shoulder-belt portions extend crosswise over the upper body-part of the body of a passenger in an X-shape and the lap-belt portion restrains the lower body-part when a shoulder- and main latch-plate are plug-in connected to an upper and main buckle-assembly. Serving as transition-products multi-point seat-belts are defined by conventional three-point seat-belts and new parts.
- 10 The user-friendliness is enhanced
- by a belt-feeding device, which, when activated, moves the first shoulder-belt portion to extend across over the upper body-part,
 - by the master release-button, which, when depressed, releases all latch-plates and/or returns the belt-feeding device to the home position,
 - 15 – by a radial-adjusting movement of the radial-adjustable tube preventing interference with the head with/without hat, and
 - by an assisting buckle-assembly, storing the released main latch-plate easily accessible by the passenger.
